SUMMARY

AI Engineer shipping production LLM agents at a payments startup: tool calling and MCP connectors, per-user OAuth access, evals, guardrails, observability and LLM cost control. I came to AI by testing an assistant with its business users before launch, and I still work close to the people I build for. I build by directing AI coding agents (Claude Code), and I review, test and verify every change before it ships.

EXPERIENCE

AI Engineer · Yuno

Jun 2026 – Present

AI Team · Onsite, India

Platform and reliability

- Root-caused a production agent outage to one malformed instruction file; reproduced it with a failing test, then fixed it at save time and read time so one bad file can no longer take an agent down.
- Shipped timeouts, request metrics and structured logs on the MCP tool gateway that every agent tool call passes through. The new logs exposed a connector failing silently in production, which I then fixed.
- Fixed agent-session failures: tool-call history with duplicate or orphaned entries that model providers rejected, and failed turns that lost the user's message.

Access and security

- Red-teamed the new agent engine before launch: chained a leaked system prompt into removing the agent's safety rules and poisoning its memory, and filed each finding as a bug report. The fix moved those guardrails out of the prompt and into the platform.
- Built a per-user OAuth 2.0 (PKCE) MCP connector so each employee's agent can only search what that employee may see; we chose per-user sign-in over a shared key. Live in production.
- Wrote the technical design and built guest access to personal AI assistants across five services, to rules set by our lead: per-guest permissions, separate credentials and isolated sessions. Released behind a feature flag.
- Closed web-security gaps: a cross-site request forgery (CSRF) logout, unverified webhook events, and credential checks that failed open (they now fail closed).

Evals and model behaviour

- Built the reply-language resolver for multilingual agents; ran it in shadow mode beside the old logic and evaluated it on a labelled test set before shipping it to production.
- Ran a small A/B test with the prompt held fixed and showed that the model, not the prompt, made agents ignore instructions; the team changed the default model.
- Added a per-turn outcome record to the agent engine, so the team can measure agent success per conversation turn in production.

Agents for business teams and customers

- Built finance-operations agents with the finance team: invoice intake, where the model extracts the fields and tested code applies the rules, and a scheduled mailbox sorter whose projected model cost I cut by changing its schedule after measuring empty runs.
- Built a collections demo agent for a talk at a customer's event: turned a colleague's script and a long thread of corrections into requirements, and tested it in the customer's language.

Letter of recommendation from Yuno's VP of AI available on request.

Payments Analyst Intern · Yuno

Dec 2025 – Jun 2026

Office of the CEO · Onsite, India

- Tested an internal AI assistant before launch with real questions from Sales and Business Development, and caught a data error behind a wrong answer.

- Built an interactive KPI dashboard for team leads by directing AI coding tools; it pulls live data from Salesforce, MongoDB and Google Sheets through their APIs.
- Built and maintained a database of which payment providers and methods work in which markets, and audited it for data-quality errors (duplicates, wrong categories, wrong regions).
- Automated manual work across the company, above all keeping partnership and payment-provider information up to date, so teams stopped updating it by hand.
- Worked directly with leadership, Sales and Partnerships to turn their questions into data they could act on.

PROJECTS

- **Smart Router** · LLM gateway · Python, FastAPI, Redis, PostgreSQL, Docker · github.com/Nityaa08/smart-router
  OpenAI-compatible API: routes each prompt to a cheaper or stronger model by rules, falls back if a provider fails, caches repeated prompts and logs each request's estimated cost; unit tests in CI.
- **Meridian** · multi-agent RAG research API · Python, FastAPI, embeddings, SSE · github.com/Nityaa08/meridian
  A planner agent splits a question, researcher agents retrieve sources in parallel, local embeddings rank the passages, a critic agent flags gaps and an LLM writes the report; every step streams live.
- **Cross-Border Fee API** · payments · TypeScript, Express, Jest · github.com/Nityaa08/cross-border-fee-api
  REST API (live demo) that itemises the price of a Latin American cross-border payment: FX spread, provider fees and local taxes.
- **Fraud Pattern Explorer** · risk analytics · TypeScript, Next.js · github.com/Nityaa08/fraud-pattern-explorer
  Risk-analyst dashboard: filters, charts, risk scores and a suspicious-patterns panel over generated data.

SKILLS

AI engineering: LLMs, AI agents, agentic workflows, tool calling (function calling), Model Context Protocol (MCP), multi-agent workflows, prompt engineering, embeddings, scheduled agents

Evals and quality: LLM evaluation (evals) with labelled test sets, shadow testing, A/B model comparison, acceptance testing, root-cause analysis

AI security: red-teaming, prompt-injection defence, guardrails, OAuth 2.0 (PKCE), access control, multi-tenant isolation, webhook verification

Production: observability (logging, metrics), incident debugging, feature-flagged releases, LLM cost optimisation, REST APIs, webhooks

Stack: Python, TypeScript, Go, FastAPI, Express, Next.js, React, PostgreSQL, MongoDB, Redis, Docker, Kubernetes, AWS, Git, GitHub Actions (CI/CD), Vercel; OpenAI and Groq APIs; Salesforce and Google Sheets APIs. (built by directing AI coding agents; I review, test and own what ships)

AI tools: Claude Code, Claude Design, Cursor, DeepSeek, Grok; personal agents in Slack for my pull request workflow

Ways of working: requirements gathering with business stakeholders, customer demos, cross-functional work across India and Latin America, payments and fintech domain

EDUCATION

B.Tech, Computer Science and Engineering (AI and Data Science) · SASTRA University · 2022 – 2026
Class XII, CBSE · Convent of Jesus and Mary

CERTIFICATIONS

- **OWASP Top 10:2025 in Go** · SecureFlag · 2026
- **Introduction to Generative AI** and **Prompt Design in Vertex AI** (skill badge) · Google Cloud · 2024
- **Supervised Machine Learning: Regression and Classification** · DeepLearning.AI and Stanford University (Coursera) · 2024
- **Prompt Engineering for Everyone** and **Create a Voice Assistant with OpenAI GPT-3 and IBM Watson** · IBM Cognitive Class · 2024
