SUMMARY

AI Engineer on the AI Team at Yuno, a payment orchestration company. I build production features for an internal multi-tenant AI agent platform by directing AI coding agents (Claude Code): I set each task, review each change and verify it before release. I joined Yuno as a Payments Analyst Intern in the Office of the CEO.

EXPERIENCE

Yuno — AI Engineer, AI Team Jun 2026 – present · Remote, India

- Root-caused an outage where one malformed instruction file took a production agent offline; fixed it at save time and at read time with a failing test first, then stopped the new error message from echoing untrusted text to the model.
- Audited the tool gateway's reliability and shipped fixes: per-backend timeouts, cancellation isolation, request metrics and structured logs. The new logs exposed a connector failing silently in production; I fixed its routing.
- Built guest access to personal AI assistants across five services, to rules set by our lead: per-guest permissions, separate credential custody and session isolation; released to production behind a feature switch.
- Built a per-user OAuth (PKCE) connector so each employee's agent can search only what that employee may see; we chose per-user sign-in over a shared key; live in production.
- Closed web-security gaps: a cross-site request forgery (CSRF) logout, unverified webhook events, and credentials that let calls through when unset (now fail closed). Patched reachable dependency vulnerabilities across several services.
- Built a reply-language resolver that decides which language each agent reply uses; ran it in shadow mode beside the old logic, measured it on a labelled test set, then shipped it to production.
- Fixed agent-session failures: duplicate or orphaned tool-call entries that model providers rejected, and failed turns that lost the user's message. Added a per-turn outcome record so the team can measure agent success per turn in production.
- Built AI agents for finance operations: an invoice-intake agent where the model reads and tested code applies the rules (verified on dev), and a mailbox-sorting agent running in production. Cut the mailbox agent's projected monthly model cost by changing its schedule, after measuring the cost of a run that found no new mail.
- Showed with a small A/B test, prompt held fixed, that the model, not the prompt, made prebuilt agents ignore instructions; the team changed the default model.
- Presented an internal AI talk to the company's AI talk series.

Yuno — Payments Analyst Intern, Office of the CEO Dec 2025 – Jun 2026

- Built and maintained a payments-capability database of providers, payment methods and markets.
- Ran a data-quality audit of that database with a documented error taxonomy: duplicates, category mismatches, region errors, unsupported methods.
- Ran acceptance testing for an internal AI assistant that answers payment-coverage questions; collected test sets from Sales and Business Development, and caught a data error before launch.

PROJECTS

- **Meridian** — multi-agent research API (Python, FastAPI). A planner agent splits a question into sub-questions, researcher agents search them in parallel, local embeddings rank the passages, a critic agent flags gaps and contradictions, and each stage streams to the client over server-sent events. github.com/Nityaa08/meridian
- **Smart Router** — LLM cost-control gateway (Python). OpenAI-compatible endpoint that routes each prompt to a cheaper or stronger model tier with rule-based classification, logs each request's estimated cost in PostgreSQL and caches repeated prompts in Redis; unit tests run in CI. github.com/Nityaa08/smart-router

SKILLS

- **AI engineering:** LLM agents (tool use, scheduled runs), MCP, OAuth, prompt-injection defence, guardrails, evals, multi-tenant isolation
- **How I build:** AI-assisted development (Claude Code): I direct coding agents, then review and verify every change
- **Codebases I shipped to with AI coding agents:** Go, TypeScript/React, Python; PostgreSQL, MongoDB, Docker, Kubernetes, AWS, Git/GitHub, CI
- **Learning now:** Python, writing it by hand

EDUCATION

SASTRA University, Thanjavur — B.Tech, Computer Science and Engineering (AI & Data Science) 2022 – 2026

CBSE Class XII, Convent of Jesus and Mary, New Delhi · Certifications: Supervised Machine Learning (DeepLearning.AI / Stanford); ML Pipelines with Azure ML Studio (Coursera)
